Part Description

Approximate description:

This appears to be a small plastic water-pump-related retainer or clip-style fitting.

The part has a round collar or socket at one end, a tapered central body, and flexible snap prongs at the opposite end. The views above are reconstructed from the committed photos and are intended for critique and comparison only. Hidden or internal features may differ from the real part.

Important: higher STL mesh density improves visual smoothness only; printed durability depends on material choice, wall count, infill, print orientation, and layer adhesion rather than PDF detail.
