

Flight Dispatcher Assessment Preparation Guide

Built from training files in *random content*, with primary emphasis on **mfs2 flightplanning User Manual_V01.04.pdf** (Flight Dispatch Manual & Procedures / FDP procedures).

Target profile: applicant with around 1 year of operational exposure.

1) Assessment Format (as shared in your message)

- Part A: Multiple-choice written exam.
- Part B: One-page written assignment.
- Subjects expected: Applied mathematics, physics fundamentals, basic chemistry related to fuels and gases, meteorology fundamentals, logical/analytical reasoning, and general aviation awareness.

2) Dispatcher Work Model (Flow-Chart View)

3) Core Dispatcher Tasks (Manual-Referenced)

Task Area	What you are expected to do	Main manual references
Shift handover discipline	Take incoming brief on weather, new NOTAMs, MEL/CDL items, outages, and (FDP-01) before taking ownership.	FDP-01 (pp. 81-82)
Special weather & volcanic monitoring	Identify below-minima or hazard weather, adjust routing/alternates, coordinate with ATIS/OMAs, and avoid volcanic ash (FDP-05).	FDP-05 (pp. 95-97), OMAs 8.4, 6.8, 6.1, 6.9
Input-sheet preparation	Prepare next-day standard, non-standard, and ETOPS planning inputs. Verify against movement plan and schedule (FDP-10).	FDP-10 (pp. 11-16)
OFP preparation/release	Validate all pre-release checks: data integrity, minima, route, fuel, MEL/CDL impact, and OFP release page timing (FDP-11).	FDP-11 (pp. 17-125), OFP-05, 16
ATS flight plan filing	File/modify/cancel ATS plans correctly and ensure ATC/AFTN addressing (FDP-12).	FDP-12 (pp. 131-182), OMAs 8.1-9
Fuel tankering	Apply cost-vs-weight logic while protecting payload and operational flexibility (FDP-14).	FDP-14 (pp. 145-147), OMAs 2.1, 2.2
Payload restriction control	Detect penalties early (weather, route, MEL, WAT, fuel) and inform load control (FDP-15).	FDP-15 (pp. 148-150)
MEL/CDL operational impact	Apply MEL constraints in planning, avoid restricted airspace/levels, and coordinate rectification (FDP-16).	FDP-16 (pp. 154), OMAs 8.6
ETOPS mindset	Maintain ETOPS en-route alternate awareness, minima discipline, and diversion (FDP-18).	FDP-18 (ETOPS section), Appendix 3 & 1
System warning response	Respond rapidly to mfs2 warnings (LOADCHG/OFPSTAT/STD/MET/NOTAM) and re-file when required (FDP-20).	FDP-20 (pp. 167-168)

4) OFP Preparation Micro-Flow (What to memorize)

INPUT VALIDATION
Airops/AIMS/load/MEL/crew data OK? → if no: correct source / manual entry

MINIMA & WEATHER GATE
Origin/Destination/Alternates above minima? → if no: add alternates / delay / reroute

ROUTE & AIRSPACE GATE
Route available, NOTAM compliant, RNP/RVSM compliant? → if no: edit route/level

FUEL & PERFORMANCE GATE
Trip + contingency + alternate + final reserve + extra factors OK? → if no: rebuild

RELEASE GATE
Publish OFP + briefing package + file ATS plan + communicate critical remarks

5) High-Yield Topics to Focus for a 1-Year Candidate

- Data quality habits: cross-checking interfaces vs source data (FDP-11).
- Minima decisions and alternates selection logic under weather deterioration (FDP-11, FDP-05).
- MEL/CDL penalties and basic RNP/RVSM dispatch implications (FDP-16).
- Fuel decisions under operational constraints: tankering vs payload safety (FDP-14, FDP-15).
- Warning management and rapid replanning (FDP-20).
- Professional handover and documentation discipline (FDP-01, Section 3 record retention).

6) Assessment Subject Preparation Plan (MCQ + Assignment)

Subject	What to revise for dispatcher context	Likely question pattern
Applied mathematics	Unit conversion (kg/lb, NM/km), speed-time-distance, fuel-rate arithmetic	Universal MCQs: quick computational logic items
Physics fundamentals	Forces in flight, drag/thrust trends, density altitude effects, climb/performance	Concept MCQs linked to takeoff/landing and cruise decisions
Chemistry (fuels/gases)	Jet fuel basics, density/temperature relation, contamination awareness	Operationally essential MCQs: fuel tanking/weight/balance
Meteorology fundamentals	METAR/TAF reading, SIGWX interpretation, wind/CB/TS impacts, minima	Simplified MCQs: whether to delay/reroute/choose alt
Logical & analytical reasoning	Prioritization under constraints, anomaly detection, sequence-based decisions	Data linking and situation-judgment MCQs.
General aviation awareness	CSAO/ATS basics, OFP/ATS linkage, MEL/CDL concepts, dispatcher-Aircrew coordination	Regulatory/procedural awareness MCQs.

7) One-Page Written Assignment Strategy

A strong one-page answer should follow a clear dispatcher structure. Use this sequence:

- 1) Situation summary (2-3 lines)
- 2) Risks identified (weather / minima / MEL / route / fuel / payload)
- 3) Dispatch analysis (what was checked and why)
- 4) Decision and justification (safe + legal + economical)
- 5) Coordination actions (IOC, crew, maintenance, load control, ATC)
- 6) Contingency plan and follow-up monitoring

Sample one-page prompt to practice

“Your destination weather falls below minima 90 minutes before ETD and one MEL item adds fuel/performance penalty. Explain how you will decide alternates, fuel strategy, ATS filing updates, and stakeholder communication.”

8) Quick Revision Checklist (Last 48 Hours Before Assessment)

- Read FDP-11 and FDP-12 end-to-end once more (OFP + ATS are core scoring areas).
- Review FDP-16 and FDP-20 for non-routine decision quality.
- Practice 20–30 mixed MCQs across math/met/aviation logic daily.

- Write at least two one-page scenario responses using the assignment structure above.
- Memorize critical references: minima logic, alternates criteria, and warning-response triggers.

Primary reference emphasis used: Flight Dispatch Manual & Procedures (mfs2 manual), especially FDP-01/05/10/11/12/14/15/16/20 and related OMA/CAR-OPS links.
